Earth beyond six of nine planetary boundaries

Almost Half of Earth's Vital Signs Are Now 'Code Red', Scientists Warn

ENVIRONMENT 29 October 2022 By DAVID NIELD

World's top climate scientists expect global heating to blast past 1.5C target

Exclusive: Planet is headed for at least 2.5C of heating with disastrous results for humanity, poll of hundreds of scientists finds

Top scientists warn of 'ghastly future of mass extinction' and climate disruption

Sobering new report says world is failing to grasp the extent of threats posed by biodiversity loss and the climate crisis

Ben Ehrenreich / March 18, 2021

We're Hurtling Toward Global Suicide

Why we must do everything differently to ensure the planet's survival

Amazon rainforest reaching tipping point, researchers say

Why biodiversity loss hurts humans as much as climate change

A UN-backed report says a million species are at risk of extinction, and warns biodiversity loss and failure to conserve ecosystems has catastrophic effects on people as well as nature.

CLIMATE IN CRISIS

Scientists warn that a key Atlantic current could collapse, among other climate tipping points

A new report describes the dire state of Earth's snow and ice, suggesting several major tipping points are likelier than scientists once thought.

The Summary

- A new report describes the dire state of Earth's snow and ice.
- Among other findings, it warns that several key climate tipping points appear more likely to be reached than previously thought.
- They include ice melt that could cause severe sea-level rise and the collapse of a crucial ocean current that governs how heat cycles in the Atlantic Ocean.

The economic commitment of climate change

[Maximilian Kotz](#), [Anders Levermann](#) & [Leonie Wenz](#) 

Abstract

Global projections of macroeconomic climate-change damages typically consider impacts from average annual and national temperatures over long time horizons^{1,2,3,4,5,6}. Here we use recent empirical findings from more than 1,600 regions worldwide over the past 40 years to project sub-national damages from temperature and precipitation, including daily variability and extremes^{7,8}. Using an empirical approach that provides a robust lower bound on the persistence of impacts on economic growth, we find that the world economy is committed to an income reduction of 19% within the next 26 years independent of future emission choices (relative to a baseline without climate impacts, likely range of 11–29% accounting for physical climate and empirical uncertainty). These damages already outweigh the mitigation costs required to limit global warming to 2 °C by sixfold over this near-term time frame and thereafter diverge strongly dependent on emission choices. Committed damages arise

Study: Pollution kills 9 million a year, costs \$4.6 trillion

Ecological Economics

Volume 224, October 2024, 108284

Despite numerous public and/or private initiatives, banks have been slow to evaluate and integrate their dependency on ES, and related risks, into their operations and performance. Using data from the ten largest European banks, we estimate that for every dollar of equity holding, 26 cents are potentially exposed to high ES dependencies. This figure should be regarded as a lower estimate of the total banks' exposure to ES dependency. To make progress, we argue that banks must become champions of ES to ensure their own resilience and financial sustainability. Governance plays a key role, and we suggest several measures to accelerate this transition.

Climate breakdown will hit global growth by a third, say central banks

New modelling finds risk to global economies much worse than previously thought, but group of central banks says even this may be an underestimate

Sandra Laville

Fri 8 Nov 2024 07:41 EST

The physical shocks caused by climate breakdown will hit global economic growth by a third, according to a risk assessment by a network of central banks.

The rise in the estimated hit to the world's economies as a result of the shocks from flooding, droughts, temperature rises, and mitigating and adapting to extreme weather was the result of [new climate modelling](#) published this year.

The Network for Greening the Financial System, a membership body of global banks and financial organisations, said [in a report](#) this week that the huge increase in the risk from physical shocks to the economy marked a considerable change in the overall severity of the damage caused.

Trust said: “This is a massive one-third hit from physical damage on GDP. It has increased more than five times, from about 6% to 33%.

“But while this is a much more severe damage risk, it is by no means comprehensive. The analogy I would use is a model of the Titanic where you can see the iceberg, but the modelling fails to recognise that there are not enough lifeboats on board, or that the cold water is a threat to human life. So this report is still systemically underestimating the risk.”

Realitycheck...

Just 57 companies linked to 80% of greenhouse gas emissions since 2016

Analysis reveals many big producers increased output of fossil fuels and related emissions in seven years after Paris climate deal

Although governments pledged in Paris to cut greenhouse gases, the analysis reveals that most mega-producers increased their output of fossil fuels and related emissions in the seven years after that climate agreement, compared with the seven years before.

In the database of 122 of the world’s biggest historical climate polluters, the researchers found that 65% of state entities and 55% of private-sector companies had scaled up production.

Ruim twee derde bedrijfswinsten is ten koste van mens en milieu

Rutger Claassen, Dirk Schoenmaker, Willem Schramade 6 september 2024

 Claassen, R. et al. (2024) ESB, te verschijnen. [178,80 kb]

Binnen veel bedrijven was decennialang alles gericht op het maken van financiële winst voor de aandeelhouders. Die focus gaat echter ten koste van de mens en het milieu.

In het kort

- Via schaduw prijzen kan de sociale en ecologische waarde-extractie door bedrijven worden geschat.
- Een grove mondiale schatting toont dat twee derde van de financiële winst voortkomt uit waarde-extractie.

Banks Have Committed to Net Zero but Aren’t on Track to Reach It

August 14, 2024 By **Anderson Lee** and **Amanda Carter** Cover Image by: eye35/Alamy Stock Photo

Only 4% of World’s Largest 2,000 Companies Meet UN Emissions Reduction Criteria Despite Record Number of Net Zero Pledges, New Report Finds

CRISIS - ATMOSPHERIC CO2 LEVELS | BY MARTINA IGINI | GLOBAL COMMONS | NOV 7TH 2023 | 3 MINS

The study looked at 1,000 companies with net zero targets in place from the world’s largest 2,000 publicly-listed companies figuring in the Forbes Global 2000 list. It found that half of the world’s largest companies are now covered by net zero targets, a clear indication that “net zero is now a corporate norm,” as Dr. Takeshi Kuramochi, Senior Climate Policy Researcher at NewClimate Institute put it.

Nevertheless, despite half of the world’s largest companies having committed to net zero by mid-century, the study found that only a small fraction of them follow United Nations guidelines for what constitutes a quality net-zero pledge in line with the [Paris Agreement](#)’s 1.5C threshold. This, Kuramochi says, is due to the fact that most targets are based on self-defined emission boundaries.

In their latest [Net Zero Stocktake](#) report, published in June 2023, Net Zero Tracker found that just 4% of company net zero commitments meet the UN ‘[Starting Line criteria](#)’, which define procedural steps for all actors in the Race to Zero, from setting a specific net zero target and clear conditions for the use of offsets to implementing immediate emission-cutting measures and regularly reporting on interim and long-term progress.

Moreover, it was found that only 37% of corporate net zero targets fully cover Scope 3 emissions, emissions that occur indirectly from activities related to an organisation’s operations, such as from the supply chain, distribution of goods, customer use of products, and disposal of waste. In many cases, this type of emissions represents the biggest proportion of a company’s total greenhouse gases output.
